**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

patentdocket@choate.com

<b>Office Action Summary</b>	<b>Application No.</b> 10/561,085	<b>Applicant(s)</b> ZGURIS, GEORGE C.	
	<b>Examiner</b> ELI MEKHLIN	<b>Art Unit</b> 1793	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 16 July 2009.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-65 is/are pending in the application.
- 4a) Of the above claim(s) 1-32 is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 33-65 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**DETAILED ACTION**

(1)

***Election/Restrictions***

Claims 1-32 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected invention, there being no allowable generic or linking claim. Applicant timely traversed the restriction (election) requirement in the reply filed on July 16, 2009.

However, the inventions listed as Groups I and II do not relate to a single general inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: Holland et al. (U.S. Patent No. 5,468,575) and Reher et al. (U.S. Publication No. 2003/0182972), as combined below, teach all the limitations of the battery, as claimed in Group I, and the process for making the battery, as claimed in Group II, meaning that there is no special technical feature between Groups I and II because all of the technical features of Groups I and II are obvious over the prior art. Specifically, Holland teaches a high-capacity lead battery. Abstract. Holland teaches that the battery is constructed by placing a fibrous web in a battery case and combining the fibrous web with an electrolyte. Col. 4, Lines 1-10. Although Holland teaches that fibrous material is added to the battery case, Holland is silent as to the diameter of the fiber in the fibrous material and whether five weight percent of the fiber in the fibrous material is capable of passing through a 4x4 mesh during a shake test.

Art Unit: 1793

However, Reher, which deals with glass fibers for use in acid batteries, teaches that at least five weight percent of the glass fibers pass through a 4x4 mesh shake test before they are used in the lead acid battery. Paragraph 59. Additionally, Reher teaches that using such fibers in lead-acid batteries improves the performance of the batteries. Paragraph 20.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention to use the glass fibers taught by Reher in the battery taught by Holland, as described above, because Reher teaches that using glass fibers, five percent of which can pass through a 4x4 mesh shake test before they are added to the battery, improves the performance of said battery. Reher, Paragraphs 20 and 59. Accordingly, because Groups I and II are obvious over the prior art, Groups I and II cannot be fairly said to have a special technical feature because the special technical features of either of Groups I and II were known in the art at the time of invention, as explained above.

(2)

***Claim Rejections - 35 USC § 112***

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 33-65 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to

Art Unit: 1793

one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Specifically, the claims, as amended, indicate that the "immediately prior" to being combined with an electrolyte, the fibrous material passes through a 4x4 shake test. However, there is no support in the Specification or Claims, as originally filed, for this processing limitation. Although Applicant teaches that the fibrous material is combined with the electrolyte and that some of the fibrous material passes this mesh shake test, Applicant did not teach, in the Specification as originally filed, that the fibrous material is combined with the electrolyte immediately after passing the mesh shake test.

(3)

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 33-65 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Applicant claims that the fibrous material passes through a "4x3 mesh during a shake test" but does not describe in the Specification what the shake test comprises, i.e. how long is the shake test performed and under what conditions. Additionally, Applicant does not describe with sufficient specificity what comprises a "4x4 mesh."

For purposes of examination, Examiner will interpret "4x4 mesh" to be a 4x4 piece of wire mesh with a mesh diameter size of 4.69 millimeters. Appropriate correction is required.

(4)

The term "immediately" in claims 33-65 is a relative term which renders the claim indefinite. The term "immediately" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. Accordingly, for purposes of examination, Examiner will interpret "immediately" to require that the fibrous material is passed through the 4x4 mesh within a reasonable length of time before the fibrous material is added to the battery case. However, this interpretation does not mean that an intervening step cannot occur before the mesh shake test and the addition of the fibrous material to the battery case.

(5)

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 33, 34, 36-45, 47-53, 55-60 and 62-65 are rejected under 35 U.S.C. 103(a) as being unpatentable over Holland et al. (U.S. Patent No. 5,468,575) in view of Reher et al. (U.S. Publication No. 2003/0182972).

With respect to **claim 33**, Holland teaches a high-capacity lead battery. Abstract. Holland teaches that the battery is constructed by placing a fibrous web in a battery case and combining the fibrous web with an electrolyte. Col. 4, Lines 1-10. Although Holland teaches that fibrous material is added to the battery case, Holland is silent as to the diameter of the fiber in the fibrous material and whether five weight percent of the fiber in the fibrous material is capable of passing through a 4x4 mesh during a shake test.

However, Reher, which deals with glass fibers for use in acid batteries, teaches that at least five weight percent of the glass fibers pass through a 4x4 mesh shake test before they are used in the lead acid battery. Paragraph 59. Additionally, Reher teaches that using such fibers in lead-acid batteries improves the performance of the batteries. Paragraph 20.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention to use the glass fibers taught by Reher in the battery taught by Holland, as described above, because Reher teaches that using glass fibers, five percent of which can pass through a 4x4 mesh shake test before they are added to the battery, improves the performance of said battery. Reher, Paragraphs 20 and 59.

With respect to **claim 34**, Holland teaches that the electrolyte comprises sulfuric acid. Col. 3, Lines 60-64.

With respect to **claim 36**, Reher teaches that the before the glass fiber is added to the battery case, the glass fiber and electrolyte are combined and then subjected to a hand sheet test (filtration) wherein some of the glass fibers are lost. Paragraph 60.

With respect to **claims 37 and 38**, Holland teaches that the electrolyte is disposed in the case before the fibrous material is disposed in the case. Col. 4, Lines 1-10. Additionally, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP 2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and fibrous material are both added to the battery, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

With respect to **claim 39**, a person having ordinary skill in the art at the time of invention would have appreciated that when a battery case is filled with electrolyte, the case is substantially devoid of any electrolyte before the electrolyte is added to the case.

With respect to **claim 40**, Holland further teaches that the battery comprises a plurality of positive and negative electrode plates that are arranged with a separator disposed between a pair of a positive electrode and a negative electrode. Col. 3, Lines 51-55.

With respect to **claim 41**, Holland teaches that some of the fibrous material (22) is disposed between the cell group (1) and the battery case cover (11). Figure 1 (depicted below).

With respect to **claim 42**, Holland teaches that the battery has a space (fringe volume) between the case and the cell and that the fibrous material (22) is disposed in the space (fringe volume). Figure 1 (depicted above).

With respect to **claim 43**, Holland teaches that the fibrous material is added around the cell, meaning that the cell is constructed before the fibrous material is disposed within the case. Col. 4, Lines 1-10.

With respect to **claim 44**, Holland and Reher, as combined above, are silent as to whether the cell is constructed before the electrolyte is disposed within the case or vice versa. However, a person having ordinary skill in the art at the time of invention would have appreciated that, since the electrolyte is an acid-containing fluid, it would have been easier and safer to construct the cell in the case before the electrolyte is added because doing so avoids the potential for acid exposure. Additionally, as discussed above, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP 2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and cell are

Art Unit: 1793

both added to the battery case, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

With respect to **claim 45**, Holland teaches that the battery can be a lead-acid battery. Col. 1, Lines 6-8, Col. 3, Lines 60-64.

With respect to **claim 47**, Reher teaches that the fibrous material that can be added to batteries can be siliceous. Paragraph 51.

With respect to **claim 48**, Reher teaches that the glass giber can have an average length of 0.1 mm to 1.5 mm. Paragraph 53.

With respect to **claim 49**, Reher teaches that the glass giber can have an average length of 0.1 mm to 1.5 mm. Paragraph 53.

With respect to **claim 50**, Reher teaches that the fibers have an average aspect ratio of less than 1,500. Paragraph 63.

With respect to **claim 51**, Holland and Reher, as combined above, teach a battery that is constructed by placing a fibrous web in a battery case and combining the fibrous web with an electrolyte. Holland, Col. 4, Lines 1-10. Holland and Reher further teach that fibrous material is added to the battery case. Holland, Col. 4, Lines 1-10. Specifically, Reher teaches that at least five weight percent of the glass fibers pass through a 4x4 mesh shake test before they are used in the lead acid battery. Reher, Paragraph 59. Additionally, Holland and Reher further teach that the battery comprises a plurality of positive and negative electrode plates that are arranged with a separator disposed between a pair of a positive electrode and a negative electrode. Holland, Col. 3, Lines 51-55.

With respect to **claim 52**, Holland teaches that an electrolyte is disposed within the case. Col. 4, Lines 1-10.

With respect to **claim 53**, Holland teaches that the electrolyte comprises sulfuric acid. Col. 3, Lines 60-64.

With respect to **claims 55 and 56**, Holland teaches that the electrolyte is disposed in the case before the fibrous material is disposed in the case. Col. 4, Lines 1-10. Additionally, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP 2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and fibrous material are both added to the battery, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

With respect to **claim 57**, a person having ordinary skill in the art at the time of invention would have appreciated that when a battery case is filled with electrolyte, the case is substantially devoid of any electrolyte before the electrolyte is added to the case.

With respect to **claim 58**, Holland teaches that some of the fibrous material (22) is disposed between the cell group (1) and the battery case cover (11). Figure 1 (depicted above).

With respect to **claim 59**, Holland teaches that the battery has a space (fringe volume) between the case and the cell and that the fibrous material (22) is disposed in the space (fringe volume). Figure 1 (depicted above).

Art Unit: 1793

With respect to **claim 60**, Holland teaches that the battery can be a lead-acid battery. Col. 1, Lines 6-8, Col. 3, Lines 60-64.

With respect to **claim 62**, Reher teaches that the fibrous material that can be added to batteries can be siliceous. Paragraph 51.

With respect to **claim 63**, Reher teaches that the glass giber can have an average length of 0.1 mm to 1.5 mm. Paragraph 53.

With respect to **claim 64**, Reher teaches that the glass giber can have an average length of 0.1 mm to 1.5 mm. Paragraph 53.

With respect to **claim 65**, Reher teaches that the fibers have an average aspect ratio of less than 1,500. Paragraph 63.

(6)

Claims 35, 46, 54 and 61 are rejected under 35 U.S.C. 103(a) as being unpatentable over Holland et al. (U.S. Patent No. 5,468,575) in view of Reher et al. (U.S. Publication No. 2003/0182972), as applied to claims 33, 34, 36-45, 47-53, 55-60 and 62-65 above, and further in view of Inagaki et al. (U.S. Patent No. 6,150,056).

With respect to **claims 35 and 54**, Holland and Reher, as combined above, teach that the electrolyte comprises sulfuric acid but are silent as to whether the electrolyte can also comprise potassium hydroxide.

However, INAGAKI, which deals with battery design, teaches that potassium hydroxide can be used as an electrolyte in a battery to help produce a battery with increased energy capacity. Col. 2, Lines 43-48, Col. 6, Lines 41-46.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention that potassium hydroxide could also be used in the electrolyte taught by Holland and Zguris, as combined above, because Inagaki teaches that potassium hydroxide can be used as an electrolyte in the production of batteries with increased capacity.

With respect to **claims 46 and 61**, Inagaki teaches that potassium hydroxide electrolyte can be used in a nickel-metal hydride battery. Col. 6, Lines 46-49.

(7)

Claims 33, 34, 37-45, 47, 49, 51-53, 55-60, 62 and 64 are rejected under 35 U.S.C. 103(a) as being unpatentable over Holland et al. (U.S. Patent No. 5,468,575) in view of Zguris (U.S. Patent No. 6,306,539).

With respect to **claim 33**, Holland teaches a high-capacity lead battery. Abstract. Holland teaches that the battery is constructed by placing a fibrous web in a battery case and combining the fibrous web with an electrolyte. Col. 4, Lines 1-10. Although Holland teaches that fibrous material is added to the battery case, Holland is silent as to the diameter of the fiber in the fibrous material and whether five weight percent of the fiber in the fibrous material is capable of passing through a 4x4 mesh during a shake test.

However, Zguris, which deals with the use of glass fibers in lead-acid batteries, teaches that glass fibers that are used as fibrous material in batteries have an average diameter of 0.8 microns. Col. 12, Lines 4-9. As explained above, a 4x4 mesh shake test passes fibers through a mesh with a diameter of 4.69 millimeters, which is the

Art Unit: 1793

equivalent of 4,690 microns. Based on this disclosure, a person having ordinary skill in the art at the time of invention would have appreciated that approximately 100% of glass fibers with a average diameter size of 0.8 microns is capable of passing through a 4x4 mesh shake test because the size of the diameter in the mesh is significantly larger than the average diameter of the glass fibers. Accordingly, at some point prior to being combined with electrolyte, 100% of the glass fibers taught by Zguris are capable of being passed through the 4x4 mesh shake test.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention to use glass fibers of the size taught by Zguris in the battery taught by Holland because Zguris teaches that batteries containing micro-fiber materials, of the type described above, exhibit increased compression resiliency.

With respect to **claim 34**, Holland teaches that the electrolyte comprises sulfuric acid. Col. 3, Lines 60-64.

With respect to **claims 37 and 38**, Holland teaches that the electrolyte is disposed in the case before the fibrous material is disposed in the case. Col. 4, Lines 1-10. Additionally, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP 2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and fibrous material are both added to the battery, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

With respect to **claim 39**, a person having ordinary skill in the art at the time of invention would have appreciated that when a battery case is filled with electrolyte, the

Art Unit: 1793

case is substantially devoid of any electrolyte before the electrolyte is added to the case.

With respect to **claim 40**, Holland further teaches that the battery comprises a plurality of positive and negative electrode plates that are arranged with a separator disposed between a pair of a positive electrode and a negative electrode. Col. 3, Lines 51-55.

With respect to **claim 41**, Holland teaches that some of the fibrous material (22) is disposed between the cell group (1) and the battery case cover (11). Figure 1 (depicted below).

With respect to **claim 42**, Holland teaches that the battery has a space (fringe volume) between the case and the cell and that the fibrous material (22) is disposed in the space (fringe volume). Figure 1 (depicted above).

With respect to **claim 43**, Holland teaches that the fibrous material is added around the cell, meaning that the cell is constructed before the fibrous material is disposed within the case. Col. 4, Lines 1-10.

Art Unit: 1793

With respect to **claim 44**, Holland and Zguris, as combined above, are silent as to whether the cell is constructed before the electrolyte is disposed within the case or vice versa. However, a person having ordinary skill in the art at the time of invention would have appreciated that, since the electrolyte is an acid-containing fluid, it would have been easier and safer to construct the cell in the case before the electrolyte is added because doing so avoids the potential for acid exposure. Additionally, as discussed above, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP 2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and cell are both added to the battery case, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

With respect to **claim 45**, Holland teaches that the battery can be a lead-acid battery. Col. 1, Lines 6-8, Col. 3, Lines 60-64.

With respect to **claim 47**, Holland and Zguris, as combined above, teach that the fibrous material that can be added to batteries can also comprise siliciferous material. Col. 18, Lines 45-47.

With respect to **claim 49**, Holland and Zguris, as combined above, teach that the fibers have a diameter of 0.8 microns. Zguris, Col. 12, Lines 4-9.

With respect to **claim 51**, Holland and Zguris, as combined above, teach a battery that is constructed by placing a fibrous web in a battery case and combining the fibrous web with an electrolyte. Holland, Col. 4, Lines 1-10. Holland and Zguris further teach that fibrous material is added to the battery case. Holland, Col. 4, Lines 1-10.

Art Unit: 1793

Specifically, Zguris teaches that the glass fibers that are used as the fibrous material in batteries have an average diameter of 0.8 microns. Zguris, Col. 12, Lines 4-9. As explained above, a 4x4 mesh shake test passes fibers through a mesh with a diameter of 4.69 millimeters, which is the equivalent of 4,690 microns. Based on this disclosure, a person having ordinary skill in the art at the time of invention would have appreciated that approximately 100% of glass fibers with a average diameter size of 0.8 microns is capable of passing through a 4x4 mesh shake test because the size of the diameter in the mesh is significantly larger than the average diameter of the glass fibers.

Accordingly, at some point prior to being combined with electrolyte, 100% of the glass fibers taught by Zguris are capable of being passed through the 4x4 mesh shake test.

Additionally, Holland and Zguris further teach that the battery comprises a plurality of positive and negative electrode plates that are arranged with a separator disposed between a pair of a positive electrode and a negative electrode. Col. 3, Lines 51-55.

With respect to **claim 52**, Holland teaches that an electrolyte is disposed within the case. Col. 4, Lines 1-10.

With respect to **claim 53**, Holland teaches that the electrolyte comprises sulfuric acid. Col. 3, Lines 60-64.

With respect to **claims 55 and 56**, Holland teaches that the electrolyte is disposed in the case before the fibrous material is disposed in the case. Col. 4, Lines 1-10. Additionally, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP

Art Unit: 1793

2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and fibrous material are both added to the battery, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

With respect to **claim 57**, a person having ordinary skill in the art at the time of invention would have appreciated that when a battery case is filled with electrolyte, the case is substantially devoid of any electrolyte before the electrolyte is added to the case.

With respect to **claim 58**, Holland teaches that some of the fibrous material (22) is disposed between the cell group (1) and the battery case cover (11). Figure 1 (depicted above).

With respect to **claim 59**, Holland teaches that the battery has a space (fringe volume) between the case and the cell and that the fibrous material (22) is disposed in the space (fringe volume). Figure 1 (depicted above).

With respect to **claim 60**, Holland teaches that the battery can be a lead-acid battery. Col. 1, Lines 6-8, Col. 3, Lines 60-64.

With respect to **claim 62**, Holland and Zguris, as combined above, teach that the fibrous material that can be added to batteries can also comprise siliciferous material. Col. 18, Lines 45-47.

With respect to **claim 64**, Holland and Zguris, as combined above, teach that the fibers have a diameter of 0.8 microns. Zguris, Col. 12, Lines 4-9.

Art Unit: 1793

Claims 35, 46, 54 and 61 are rejected under 35 U.S.C. 103(a) as being unpatentable over Holland et al. (U.S. Patent No. 5,468,575) in view of Zguris (U.S. Patent No. 6,306,539), as applied to claims 33, 34, 36-45, 47, 49, 51-53, 55-60, 62 and 64 above, and further in view of Inagaki et al. (U.S. Patent No. 6,150,056).

With respect to **claims 35 and 54**, Holland and Zguris, as combined above, teach that the electrolyte comprises sulfuric acid but are silent as to whether the electrolyte can comprise potassium hydroxide.

However, INAGAKI, which deals with battery design, teaches that potassium hydroxide can be used as an electrolyte in a battery to help produce a battery with increased energy capacity. Col. 2, Lines 43-48, Col. 6, Lines 41-46.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention that potassium hydroxide could also be used in the electrolyte taught by Holland and Zguris, as combined above, because Inagaki teaches that potassium hydroxide can be used as an electrolyte in the production of batteries with increased capacity.

With respect to **claims 46 and 61**, Inagaki teaches that potassium hydroxide electrolyte can be used in a nickel-metal hydride battery. Col. 6, Lines 46-49.

(9)

Claim 36 is rejected under 35 U.S.C. 103(a) as being unpatentable over Holland et al. (U.S. Patent No. 5,468,575) in view of Zguris (U.S. Patent No. 6,306,539), as applied to claims 33, 34, 36-45, 47, 49, 51-53, 55-60, 62 and 64 above, and further in view of Fang (U.S. Patent No. 4,238,303).

Art Unit: 1793

With respect to **claim 36**, Holland and Zguris, as combined above, teach that the fibrous material and the electrolyte are both disposed within the battery case. Col. 4, Lines 1-10. Additionally, as per the MPEP, the selection of any order of performing process steps is *prima facie* obvious in the absence of new or unexpected results. MPEP 2144(IV)(C). Accordingly, because Holland teaches that the electrolyte and fibrous material are both added to the battery, the order in which the components are added is not patentably distinct absent evidence of new or unexpected results.

Additionally, Fang, which deals with the use of glass fibers in an electric cell, teaches a manufacturing process wherein the components to which the glass fibers are added are pre-mixed with the glass fiber and then filtered. Col. 8, Lines 28-36. Specifically, Fang teaches that the fiber-containing dispersion is filtered and then formed into the diaphragm, which is added to the electric cell. Col. 8, Lines 28-36.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention to filter the fibrous material-containing electrolyte, as taught by Holland and Zguris, as combined above, because Fang teaches that such a production process can be used to effectively prepare a fibrous material for electric cells.

(10)

Claims 48, 50, 63 and 65 are rejected under 35 U.S.C. 103(a) as being unpatentable over Holland et al. (U.S. Patent No. 5,468,575) in view of Zguris (U.S. Patent No. 6,306,539), as applied to claims 33, 34, 36-45, 47, 49, 51-53, 55-60, 62 and 64 above, and further in view of Cusick et al. (U.S. Patent No. 6,227,009)

Art Unit: 1793

With respect to **claims 48 and 63**, Holland and Zguris, as combined above, teach that the glass fibers in the fibrous material have an average diameter of 0.8 microns but are silent as to the length of the fibers.

However, Cusick, which deals with fibrous material for use in lead-acid batteries, teaches that glass fibers with a length of 1 millimeters can be in lead-acid batteries.

Col. 14, Lines 35-37.

Therefore, it would have been obvious to a person having ordinary skill in the art at the time of invention to use a fiber with a length of 1 millimeters in the battery taught by Holland and Zguris, as combined above, because Cusick teaches that fibers of that length can be effectively used in lead-acid batteries.

With respect to **claims 50 and 65**, Holland, Zguris and Cusick, as combined above, teach that the glass fibers have an average diameter of 0.8 microns and an average length of 1.0 millimeters. This means that the fibers have an average aspect ratio of 1250, which is less than 1,500.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to ELI MEKHLIN whose telephone number is (571)270-7597. The examiner can normally be reached on 5/4/9.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jerry Lorengo can be reached on 571-272-1233. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
